

ABSTRACT

A seat cushion includes a pair of generally flat pads for supporting a user's buttocks and a handle disposed between the pads for carrying the seat cushion. Arms, interconnecting the pads and the handle are provided for holding the pads in both a spaced apart relationship and enabling grasping of the handle by a user. The arms are flexible for enabling the pads to be oriented in both a planar relationship for supporting the user's buttocks and a coplanar relationship for enabling transport of the seat cushion by the handle.
